

== [apollo_asm](#) ==

add

Operation:

Source + Destination -> Destination

ADD <ea>, Dn

ADD Dn, <ea> Attributes: Size = (Byte, Word, Long, Quad)

Description:

Adds the source operand to the destination operand using binary addition, and stores the result in the destination location. The size of the operation may be specified as byte, word, long, or Quad.

Usage example:

- [loop based counter](#) 2016/08/19 21:38 Nicolas Sipieter
